Graphic Recorder

KR2S

[Communication Interface]

Instruction Manual

Thank you for purchasing the KR2S series graphic recorder.

Before using your new recorder, please be sure to read this instruction manual that will advise you on how to use the instrument correctly and safely and how to prevent problems.

— Request to instrumentation engineers, constructors, and sale agents —
Make sure to deliver this instruction manual to the operator of this instrument.

— Request to the operator of this instrument —
This instruction manual is necessary for maintenance, too. Keep this manual with care until the instrument is discarded.

The CHINO logo is displayed in a bold, sans-serif font, with the letters 'CHINO' stacked vertically.

Introduction

This manual describes the specifications and operation of three communications interfaces (RS-485 and Ethernet) of the KR2S series graphic recorders.

The individual part for each communication is explained separately in [In case of RS-485] and [in case of Ethernet], and the common part is explained all together. Please read the required part carefully. Be sure to confirm the model code of the communications interface of this unit you purchased.

KR2S□□ - □□□

Communication interface (option)

N: None

E: Ethernet

R: Low/high order communications (RS-485)

G: Ethernet + low/high order communications (RS-485)

◆ Other manuals to be consulted

This manual is for the communications interface only. For the installations of this instrument, please refer to the following separate manuals:

- 1) KR2S General Manual (Manual No. INE-861□)
- 2) KR2S [Wiring/Installation] Instruction Manual (Manual No. INE-862□)
- 3) SC8-10 Line Converter (Manual No. INE-39)

* For the personal computer (PC) you use, refer to the manual attached to the PC.

◆ Caution display

The cautions to be observed for preventing the damage of this instrument and unexpected accidents are sorted by the following symbols according to their importance degrees for enabling operators to use this instrument safely.

Caution

The nonobservance of information under this symbol may result in a hazardous situation or a light injury to the user or in physical damage to the property.

Remarks

This symbol shows a caution when the instrument dose not function as specified or when such a possibility exists.

Important notes for users

1. No part of this manual can be reproduced or copied in any form without permission.
2. The contents of this manual may be altered without prior notice.
3. This manual has been documented by making assurance doubly sure.
However, if any question arises or if any error, an omission, or other deficiencies are found, please contact your nearest CHINO's sales office.
4. CHINO is not responsible for any operation results of this software.

1 For safe use

This section “For safe use” has been compiled to promote the correct use of the instrument in order to prevent human injury or damage to property before they occur. If this instrument is used other than description of this document, protection provided by the instrument may be vitiated. Please read the following information carefully and be sure to observe the warnings and cautions in it.

1-1 Preconditions for use

This instrument is a component type general product to be mounted on an indoor instrumentation panel. Do not use this instrument in different situations.

Before using this instrument, ensure the system safety by taking appropriate measures such as fail-safe designing and periodic maintenance for the equipment to which this instrument is installed. Connection, adjustment or operation of this instrument should be performed by a professional engineer with knowledge of instrumentation.

Also, a person who handles this instrument should read this instruction manual to fully understand the cautions and basic operations.

1-2 Labels on this instrument

The following labels are used for safe use.

Label	Name	Meaning
	Alert symbol mark	Indicates the location which should refer to the manual in order to prevent an electric shock and injury.
	Protective conductor terminal	A terminal is provided for connection to the protective conductor of the power supply facility for the prevention of an electric shock.

1-3 Symbols in this manual

The cautions to be observed for preventing the damage of this instrument and unexpected accidents are sorted by the following symbols according to their importance degrees for enabling operators to use this instrument safely.

 Warning	The nonobservance of information under this symbol may result in hazardous, critical or serious injury to the user.
--	---

 Caution	The nonobservance of information under this symbol may result in a hazardous situation or a light injury to the user or in physical damage to the property.
--	---

Remarks	This symbol shows a caution when the instrument does not function as specified or when such a possibility exists.
----------------	---

Reference	This reference serves as a supplement for handling and operation, and it may be convenient for the user.
------------------	--

2 General

The communications interfaces available in this unit are Ethernet as standard and the serial communications RS-485, as an option. Via these communications, a PC can receive measured data and set various parameters.

2-1 RS-485 communications interface

The RS-485 communications interface can communicate with multiple KR2S series graphic recorders (RS-485 up to 31 sets) in parallel by signals conforming to the RS-485.

There are few PCs having the RS-485 communications interface. However, since these communications interfaces are characterized with serial communications, it is easily connectable to a PC having the RS-232C communications interface by using an RS-232C/RS-485 signal-converting unit. A line converter (Model SC8-10) is available for RS-232C/RS-485 signal conversion from CHINO.

2-2 Ethernet

Ethernet is the communications standard specified in IEEE802.3 and is the most widely installed small-sized LAN technology. The KR2S series graphic recorder is connected to a LAN established by the Ethernet and performs reception of measured data, setting of various parameters, etc.

For the specifications of this unit, connections for the Ethernet, etc., refer to the general manual for this unit.

3 Communication protocol

3-1 MODBUS protocol

The KR2S series graphic recorder employs MODBUS protocol as the communications protocol.

The MODBUS protocol has RTU mode and ASCII mode that can be selected by keys on the front of this unit or the communications.

By using the MODBUS protocol, operation of measurement, setting, etc. to instruments can be performed.

Ethernet interface performs by implementing the MODBUS protocol on TCP protocol packet.

* MODBUS is a registered trademark of Schneider Automation Inc.

4 Communications specifications

4-1 Serial communications

Specifications of the serial communications of this unit are as follows. * mark shows factory default settings.

Communication system	Half-duplex Start-stop synchronization (polling selecting system)
Protocol	MODBUS protocol
Transmission mode	RTU mode*/ASCII mode
Transmission speed	9600 */19200 bps selectable
Start bit	1 bit
Data length	7 bits/8 bits*(depended on transmission mode)
Parity bit	Non* (none)/Even/Odd(depended on transmission mode)
Stop bit	1 bit*/2 bits(depended on transmission mode)
Transmission code	Binary*(RTU mode)/ASCII(ASCII mode) (depended on transmission mode)
Error check	CRC-16*/LRC (depended on transmission mode)
Data transmission procedure	No procedure
Signals used	Transmission/reception of data only (Control signal not used)
Other	External units precedence communications system

4-2 Ethernet communications

Specifications of the Ethernet communications of this unit are as follows.

Media	Ethernet (10BASE-T/100BASE-TX)
Communications mode	Full-duplex/Half-duplex
Communications speed	10Mbps (10BASE-T)/100Mbps (100BASE-TX) However, as the communications speed and the communications mode are automatically recognized, fixed settings are disabled.
Protocol	MODBUS (RTU) protocol on TCP/IP
Number of simultaneous connection	1 (for high order communications using the MODBUS protocol only)

This unit provides functions of Web, FTP, etc., but this manual describes data communications using MODBUS communications only.

The relation of the MODBUS communications and TCP/IP layers are shown in the table below.

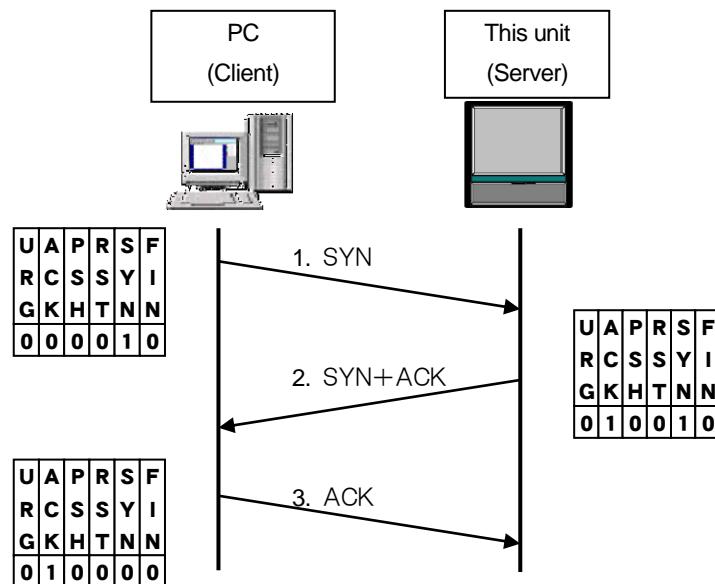

TCP/IP Model Layers	Main protocols used in Ethernet communications
Application layer	MODBUS
Transport layer	TCP
Internet layer	IP, ARP
Physical layer/Data link layer	Hardware (Ethernet)

For details of the MODBUS protocol, refer to **7 MODBUS protocol**.

4-2-1 Establishment of TCP connection

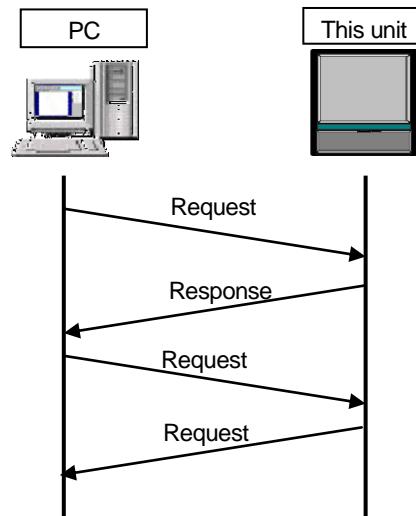

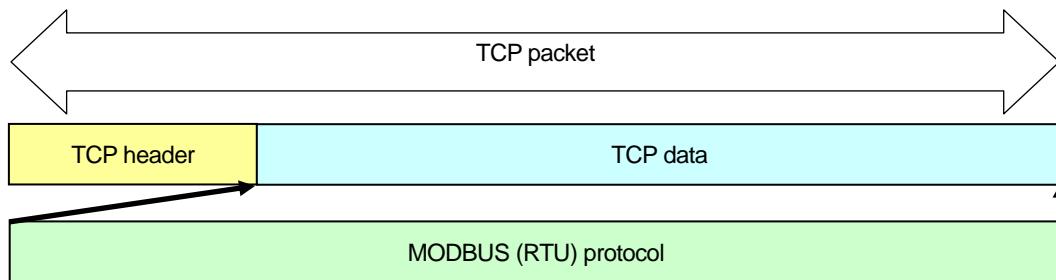

When the high order communications between a PC (the side which requires data: Client) and this unit (the side of which data is required: Server) is performed, it starts from establishing a TCP connection according to the following procedures first.

1. The PC transmits the TCP packet with the SYN flag set to this unit.
2. When this unit receives the SYN packet, it transmits the TCP packet the SYN+ACK flags set to the PC.
3. When the PC receives the SYN+ACK packet, it transmits the TCP packet with the ACK flag set to this unit.

4-2-2 Data transmission and reception through TCP

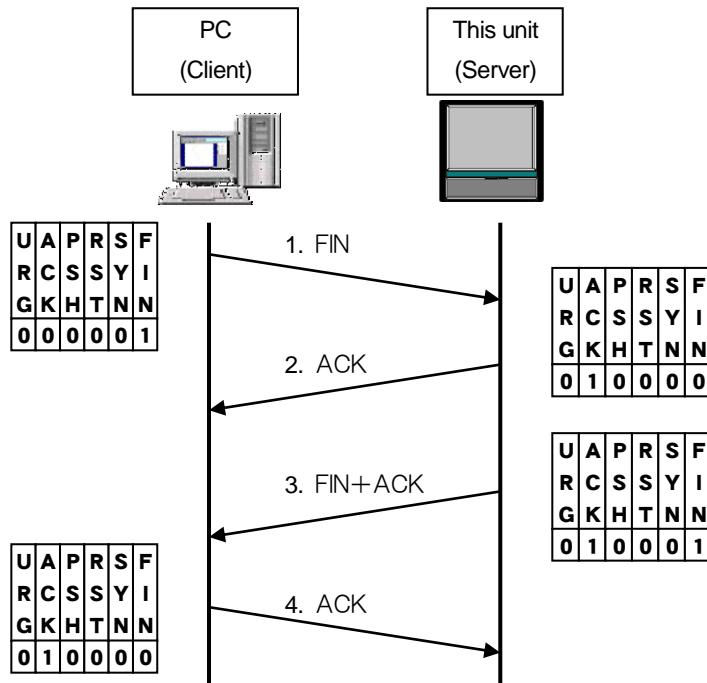

When the connection is established, transmission and reception of various data through the MODBUS (RTU) protocol on the TCP data between the PC (Client) side and this unit (Server) are performed.

4-2-3 Disconnection of TCP connection

The communication flow at the disconnection of the TCP connection is as follows.

1. The PC transmits the TCP packet with the FIN flag set to this unit.
2. When this unit receives the FIN packet, it transmits the TCP packet the ACK flag set to the PC.
3. This unit transmits the FIN+ACK packet to the PC.
4. The PC transmits the ACK packet responding to the FIN.

4-2-4 Functions at communications failure

The followings are functions of this unit when the communications failure on the TCP/IP occurs.

- In case that there is no response from a communication partner (PC, etc.)
 When a response (ACK) packet does not return after this unit transmits data to a communication partner on Ethernet, this unit repeats to retry transmission (up to about 3 minutes).
 When there is no response also to the transmission retry packet, this unit disconnects the TCP connection.

When the communication partner requests to connect the TCP connection to this unit before this unit disconnect the TCP connection, this unit transmits the RST packet to refuse the connection.

In addition, this unit transmits the RST packet in the following cases.

- When this unit receives the TCP packet from other than the partner being connected
- When this unit receives the RST packet from the communication partner
- When this unit receives an unexpected reply packet
 Fundamentally, this unit ignores the unexpected reply packet. However, this unit disconnects the TCP connection as soon as it receives the RST packet in case of forcible disconnection of the TCP connection by the PC side and so on.

5 Confirmation of communications specifications and settings

5-1 Confirmation of communications specifications

When the serial communication is used, confirm the model of this instrument before installations and connections.

KR2S□□ - □□□

Communication interface (option)

N: None

E: Ethernet

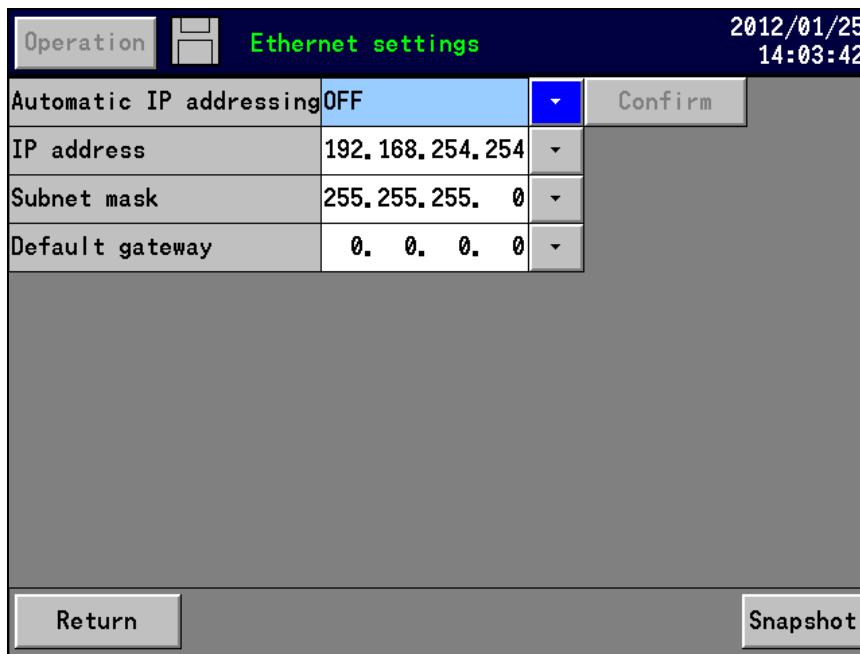

R: Low/high order communications (RS-485)

G: Ethernet + low/high order communications (RS-485)

5-2 Settings from this unit

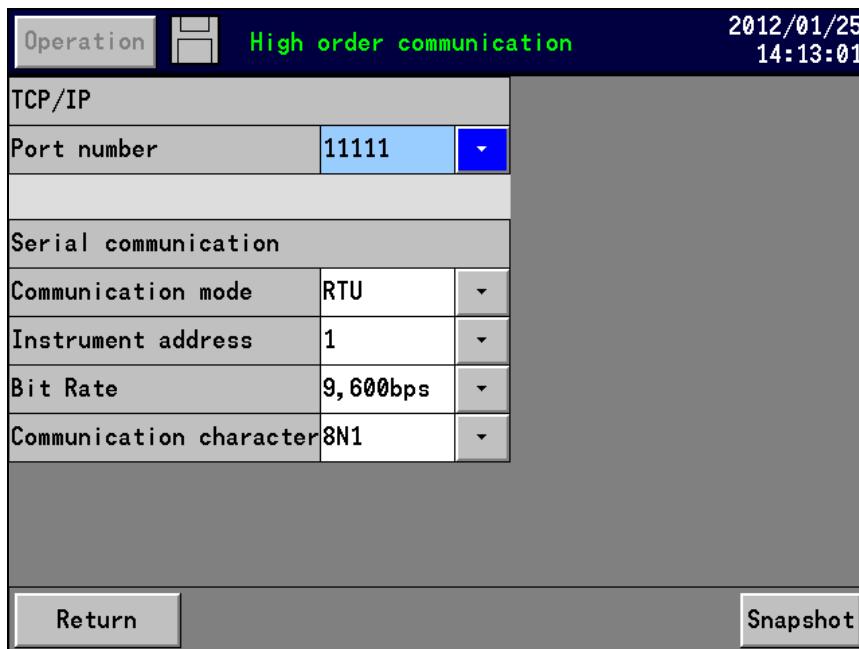

5-2-1 Settings for Ethernet

Tap the [Operation] button and then tap [MENU settings] - [Network settings] - [Ethernet settings], the following screen is displayed.

5-2-2 Settings for High order communications

Tap the [Operation] button and then tap [MENU settings] - [System settings] - [High order communication], the following screen is displayed.

Port number	Specify the port number used in the high order communications* via Ethernet.
Communications mode	Select the RTU/ASCII.
Instrument address	Set an arbitrary number in the range from 01 to 31.
Bit rate	Select 9600bps or 19200bps.
Communications character	Select it from the codes listed below.

* In case of the high order communications via Ethernet, the communications mode is the RTU and the instrument address is fixed at "01".

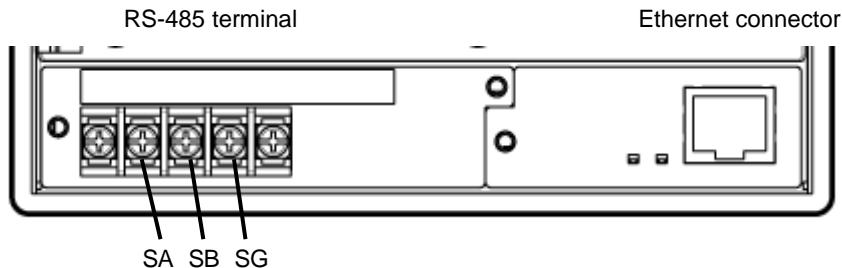

Code	Character length	Parity	Stop bit
7E1	7 bits	Even	1
7E2			2
7O1		Odd	1
7O2			2
8N1	8 bits	None	1
8N2			2
8E1		Even	1
8E2			2
8O1		Odd	1
8O2			2

*Codes are used to represent characters. MODBUS RTU mode can set only 8-bit characters(see Section 7-1).

6 Connections

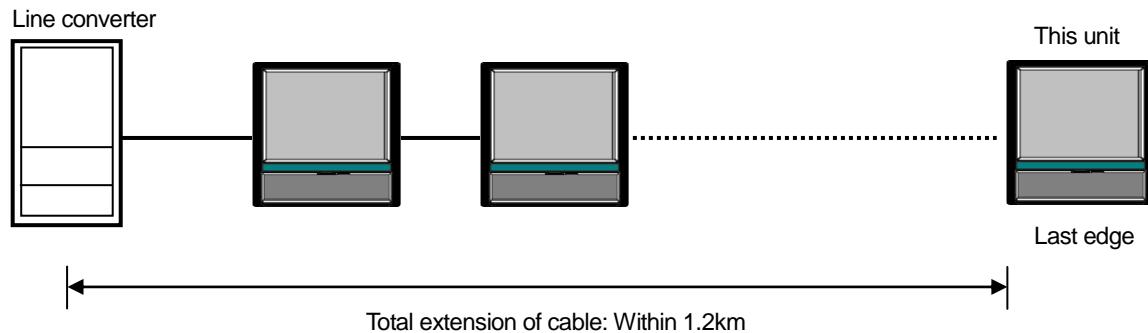

6-1 Connection precautions

6-1-1 Communications Terminals

6-1-2 Total extension of RS-485 communications cable is up to 1.2km.

The wiring distance between each instrument is arbitrary, but the total extension length of cable is within 1.2km.

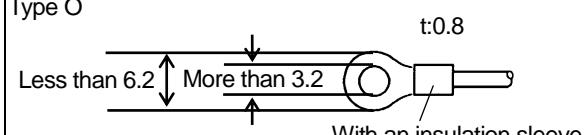

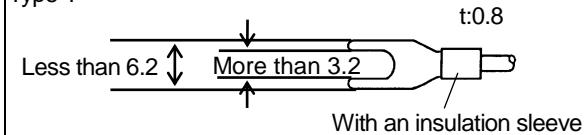

6-1-3 Take measures against noise

Separate the communications cable from power lines and other communications lines more than 50 cm not to be affected by noise.

In addition, when the communications using a PC or an Ethernet hub are performed, depending on circumstances, the hub, communications ICs, or the PC itself may be strongly affected by noise and failures may occur in communication with this unit. In this case, take sufficient measures against noise for the communication lines, the power lines, etc.

6-1-4 Crimp type terminals

Falling off of connections is one of communications failures. Terminate the communications cable with crimp type ring or spade terminals with an insulation sleeve. (The terminal screws of KR2S series graphic recorders are M4mm and the terminal screws of the line converter are M3.5mm.)

Terminal name	Screw diameter	Tightening torque	Termination (Unit: mm)
Communication terminal	M3	0.5N·m	<p>Type O</p>  <p>With an insulation sleeve</p> <p>Type Y</p>  <p>With an insulation sleeve</p> <p>*Use Type O whenever possible.</p>

6-1-5 Attach a termination resistor

For using the RS-485 communications, mount a $100\ \Omega$ resistor to the KR2S series graphic recorder connected at the final end. (For details, see Section 4-3)

[A general metal film resistor can be used. The resistor (sold separately) is available at CHINO.]

However, there are also environments where a communication error cannot take place easily without the termination resistor attached

6-1-6 Number of this unit connectable

Up to 31 sets

 Caution	<p>The distance and the number that can be communicated in the high quality according to the kind of the communications cable used or the connected equipment are different though communication IC in accordance with each communication standard is used about connected the number.</p> <p>Especially, please note that the number that can be connected becomes ten or less when the equipment using communication IC that conforms only to RS-422A standard is connected with the same communication line as KR2S.</p>
--	---

6-2 Communications cables

Use communications dedicated cables. Communications dedicated cables (sold separately) are available at CHINO.

6-2-1 Communications cables for RS-485

1. Connections between a line converter and the KR2S series recorder.

Cable	Crimp type ring terminals ⇔ RS-485 with crimp type ring terminals
Shape	<p>The cable consists of a twisted dual-core CVVS wires with SG (signal grounding) wire at both ends. As the line converter has no SG terminal, cut this wire to use.</p>
Internal wiring	
Type code	RZ-LEC□□□ <p>Cable length: 1 to 99m (to be specified)</p>

2. Connections between the KR2S recorder and the KR2S recorder.

Cable	Crimp type ring terminals ⇔ RS-485 with crimp type ring terminals
Shape	<p>The cable consists of a twisted dual-core CVVS wires with SG (signal grounding) wire at both ends. As the line converter has no SG terminal, cut this wire to use.</p>
Internal wiring	
Type code	RZ-LEC□□□ <p>Cable length: 1 to 99m (to be specified)</p>

6-2-2 Communications cables for Ethernet

1. Connection between PC and device

When connecting a device to a PC directly (one-to-one), use a shielded, crossover twisted pair cable (commercially available STP cable).

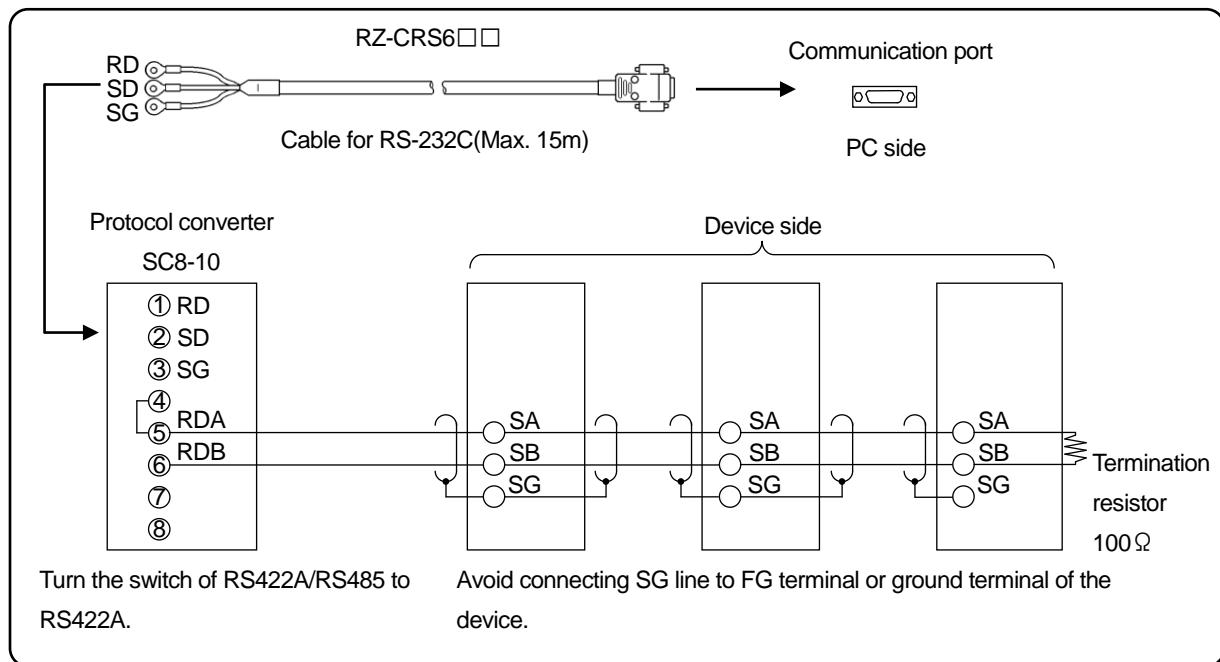

2. Connection between HUB and device(multiple devices can be connected)

When connecting devices to a PC via HUB (one-to-N), use a shielded, straight pair cable (commercially available STP cable).

6-3 Communication Line Wiring

6-3-1 Connections of High order communication RS-485

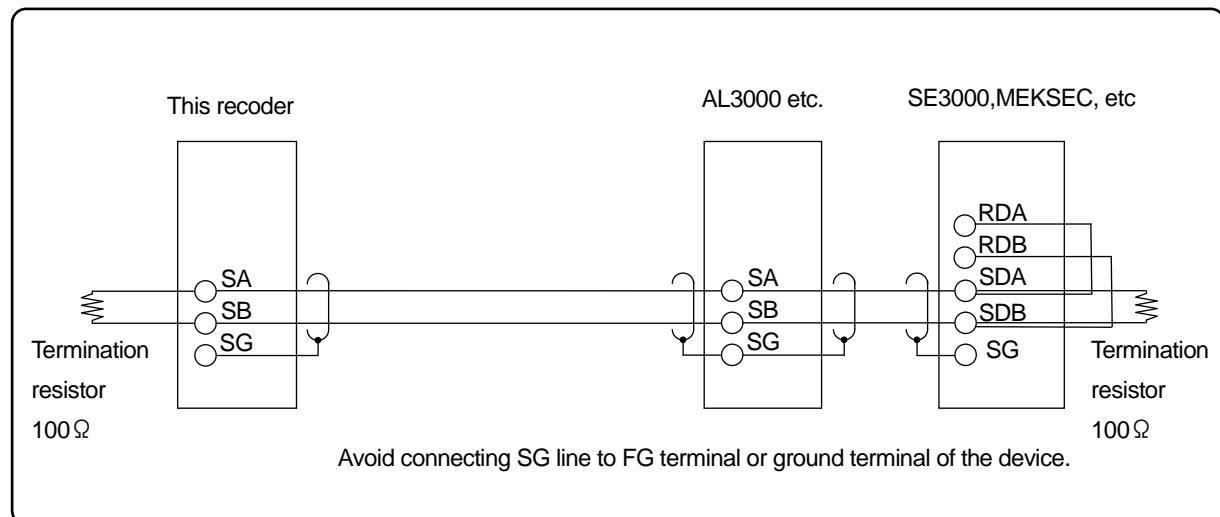

The RS-485 communications interface is connected to a personal computer via a protocol converter. Three signals of SA, SB and SG are used between the protocol converter and a personal computer and a control signal is not used. Wiring process of connector differs from how the personal computer uses the control signal hence please understand your personal computer.

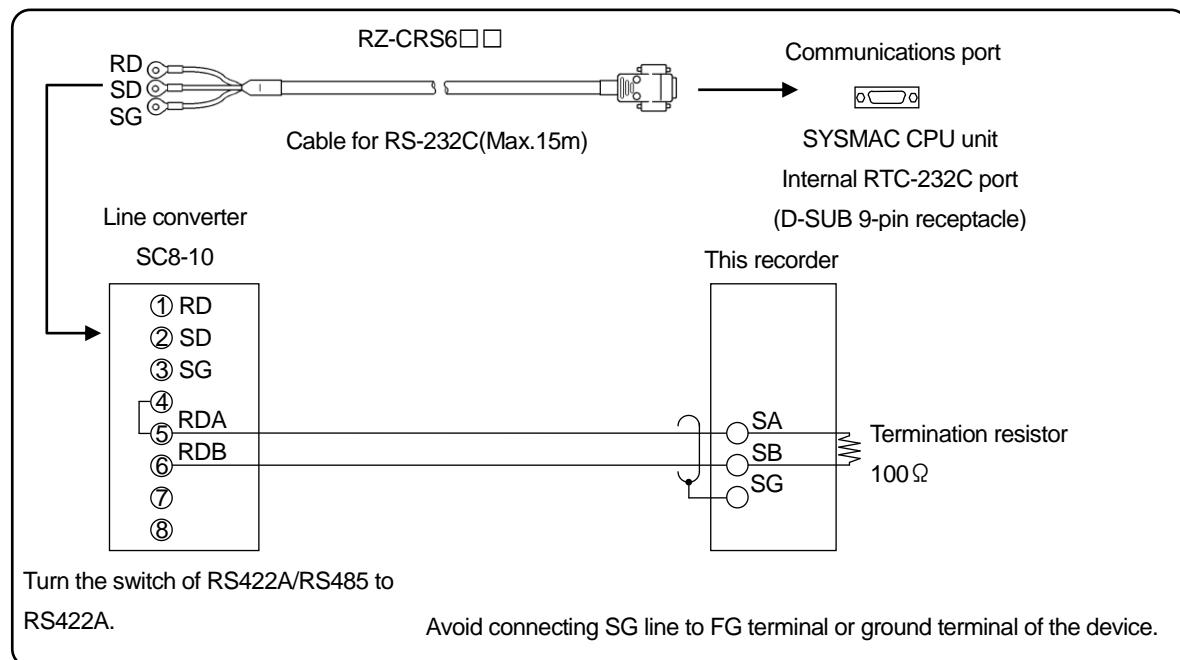

6-3-2 Connections of low order communication RS-485

Connect SA1, SB1 of KR2S and SA, SB of low order connected instrument like the following figure. Refer to instruction manual of each instrument for detail method of low order instrument connection.

Example of terminal connection 1

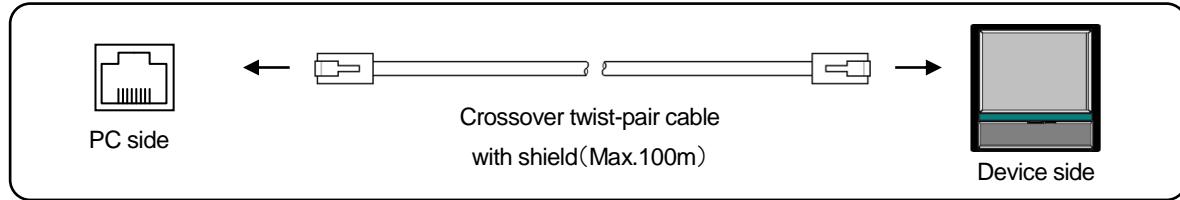

Example of terminal connection 2(SYSMAC)

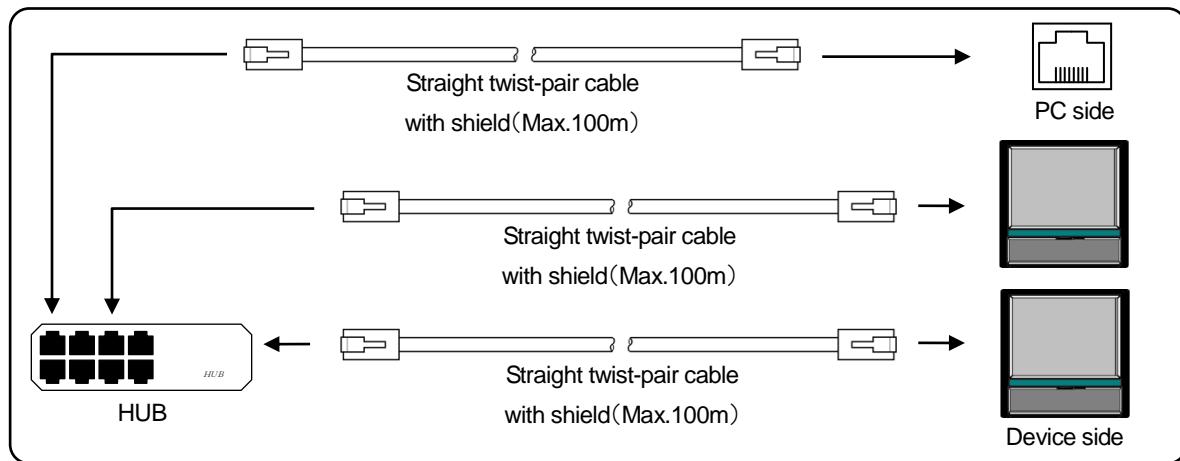

6-3-3 Ethernet wiring

- ① Example of connection between PC and Ethernet devices(one-to-one connection)

- ② Example of connection between PC and HUB/Ethernet devices(one-to-N connection)

7 MODBUS protocol

Caution

Make sure to read and understand this section to avoid any troubles.

1. Requesting data immediately after power-on generates an error

The unit is always ready for communications and responsive to data request from PC. However, after power-on, the unit does not respond normally until channel data becomes ready.

2. As the control signal wire is not used, pay attention to retransmit a command.

The serial interface of this instrument communicates without using control wire.

Pay attention to retransmit a command as reception defects may occur depending on the status of this instrument.

3. Do not remove any devices or communication cables and do not turn ON or OFF the power supply during communications.

If devices or cables configuring the serial interface are removed or if the power is turned ON (OFF) during communications, the communications may stop or an error may occur. If this happens, reset all the devices configuring the serial interface and restart the communications from the beginning.

4. Transmit the next command after confirming that the communication drive is switched OFF.

In RS-485, if multiple instruments are connected to same communications line, then only 1 instrument, of which instrument number is specified from the PC, drives the communications line. At that time, for transmitting all the characters to the PC completely, the drive of the communications line is turned OFF with some time interval after the last character is sent. If the PC transmits a command to the next instrument before it becomes OFF, then the signal crashes and normal communications cannot be done. Therefore take care when a high speed PC is used. This interval is around 5ms.

7-1 Transmission mode of message

There are 2 types of the RTU (Remote Terminal Unit) mode and the ASCII mode.

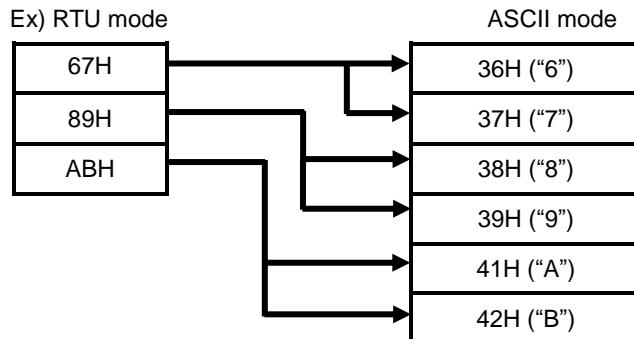

(Table 1. Comparison of RTU mode and ASCII mode)

Item		RTU mode	ASCII mode	
Transmission code		Binary	ASCII	
Error detection (Error check)	Vertical direction	Parity		
	Horizontal direction	CRC-16	LRC	
Character configuration	Start bit	1 bit		
	Data bit	8 bits	7 bits, 8 bits	
	Parity bit	None, odd, even	None*, odd, even	
	Stop bit	1bit/2 bits		
Message start code		None	:	(Colon)
Message end code		None	CR, LF	
Data time interval		Less than 28-bit hours	Less than 1 second	

* When the data bit is 7 bits, [Parity bit None] is not applicable.

7-1-1 Transmission data

The RTU mode is binary transmission. The ASCII mode divides 8 bits binary of the RTU into higher 4 bits and lower 4 bits and converts into characters respectively (0-9, A-F).

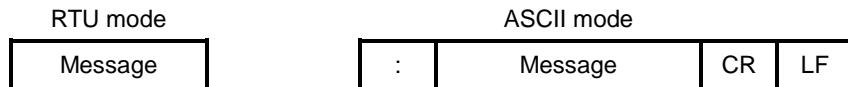

The RTU mode is half in the message length as compared to the ASCII mode and enables the efficient transmission.

7-1-2 Message frame configuration

The RTU mode is configured by message parts only.

The ASCII mode is configured by the start character “: (colon, 3AH)”, messages and the end character “CR (carriage return, ODH) + LF (Line feed, OAH)”.

As the ASCII mode has the start character of “:” it has an advantage that the troubleshooting is easy.

7-2 Data time interval

RTU mode: Less than 28-bit hours (2.8msec at 9600bps, 1.4msec at 19200bps)

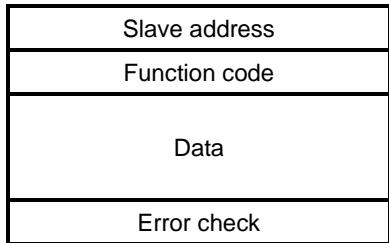

ASCII mode: Less than 1 second

When a message is sent, be careful that the time interval of data configuring one message does not exceed the time shown above. If the time interval exceeds the time shown above, the receiving side (this unit) judges that the transmission from a sender is finished and the data are processed as the reception of an abnormal message.

In the RTU mode, message characters should be sent continuously, but in the ASCII mode, as the interval between the characters is maximum 1 second, a master (PC) whose processing speed is comparatively slow can be used.

7-3 Message configuration

The MODBUS messages have the following configuration for both of the RTU mode and the ASCII mode.

7-3-1 Slave address

Slave addresses should be set in advance in a range of 1-31. The master usually communicates with 1 slave. Only the slave corresponding with the slave address in the command message from the master responds to that message.

The slave address “0” is used in messages (Broadcast) to all the slaves from the master. In this case, the slaves do not return any response.

7-3-2 Function code

The function codes are the codes to be performed in the slaves and each data is roughly categorized as follows. The table shows original functions of MODBUS and functions of our MODBUS instruments.

(Table 2. Function codes)

Code	Function	Unit	MODBUS original function (Reference)
01	Reading of digital (ON/OFF) setting value	1 bit	Reading the status of coil
02	Reading of digital input data	1 bit	Reading the status of input relay
03	Reading of analog setting value	16 bits	Reading the content of holding register
04	Reading of analog input data	16 bits	Reading the content of input register
05	Writing digital setting value	1 bit	Changing the status of single coil
06	Writing analog setting value	16 bits	Writing to single holding register
08	Transmission of received data (for diagnosis)		Loop back test
16	Writing multiple analog setting values		Writing to multiple holding registers

1. **Digital settings value** Parameters to change functions including record ON/OFF, marker text record, etc.
2. **Digital input data** Data of event activation status, etc.
3. **Analog settings value** Various setting information.
Numeric values are in the range of 16 bits (-32763 to 32767).
4. **Analog input data** Measurement data, instrument specification information, etc.
Numeric values in the range of 16 bits are outputted.

7-3-3 Data part

Data structures differ depending on the function codes. In case of requests from the master, they are configured by a code number (relative numbers calculated from reference numbers mentioned hereafter) of the target data for reading/writing and number of data, etc. Responses from the slaves are configured by data requested by a command etc.

All basic data of MODBUS are 16-bit integers and existence of a mark is decided for each data. Therefore real values of data like measured values are expressed by allocating a decimal place to a different address or by normalizing with high/low values of a scale while the decimal place is fixed. This instrument adopts the allocation method of the decimal place to a different address.

 Caution	<p>In the data part, there are specific numeric values such as input data allocated as error data. When using such data, perform the error judgment of data first and then combine them with decimal point data.</p> <p>If such error data are combined with decimal point data first, they are judged as normal data.</p>
--	--

7-3-4 Reference number

Numbers called “Reference numbers” are allocated to all the data of this instrument and these numbers are necessary for reading/writing data.

The data are classified into “Digital setting values”, “Digital input data”, “Analog input data” and “Analog setting values” depending on their types. Number designation in messages is performed by relative numbers corresponding to the respective reference numbers.

(Table 3. Reference numbers and relative numbers)

Data type	Reference number	Relative number	MODBUS original (Reference)
Digital setting value	1 to 10000	Reference number - 1	Coil
Digital input data	10001 to 20000	Reference number - 10001	Input relay
Analog input data	30001 to 40000	Reference number - 30001	Input register
Analog setting value	40001 to 50000	Reference number - 40001	Hold register

For example, the relative number of “Reference number 30101 (Data of Channel 1)” mentioned later becomes “100”.

(Table 4. Reference numbers)

Data type	Parameter	Reference number	Corresponding function code	Reference table
Digital setting value	Key lock Record ON/OFF Marker text writing	1 to 20	01 (READ) 05 (WRITE)	Para. 8-1
Digital input data	Event status	10101 to 10800	02 (READ)	Para. 8-2
Analog input data	Instrument information Measurement data	30001 to 30094 30101 to 30188	04 (READ)	Para. 8-3
Analog setting value	Common parameter (Date/time, High order communications, processing reset, etc.)	40001 to 40098	03 (READ) 06 (WRITE) 16 (WRITE)	Para. 8-4
	Setting parameter for each channel	40102 to 44500		
	Communications parameter	45001 to 45486		
	Lower communications parameter	45501 to 45544		
	Group parameter	46001 to 46500		
	Common parameter (screen, schedule, etc.)	47110 to 47167		
	File-related-parameter	47207 to 47700		
	Marker text	48001 to 48950		
	Low order communications Setting(PLC)	48951 to 48985		
	Web server setting	49001 to 49064		

7-3-5 Error check

The error check of transmission frame differs depending on the mode.

RTU mode: CRC-16

ASCII mode: LRC

1. Calculation of CRC-16

The CRC method divides the information to be sent by a generating polynomial and transmits it by attaching the calculated remainder to its end. The generating polynomial is as follows.

$$1 + X^2 + X^{15} + X^{16}$$

The following calculation is performed for information from a slave address to the end of data.

- 1) Initialization (=FFFFH) of data of CRC-16 (consider as X)
- 2) Exclusive OR of data 1 and X (EX-OR) → X
- 3) 1-bit shifting of X to the right → X
- 4) For a carry existed, A001H and EX-OR are taken, else go to 5). → X
- 5) 3) and 4) are repeated up to 8-time shifts.
- 6) EX-OR of the following data and X → X
- 7) Same as 3) - 5)
- 8) Repeating up to the last data.
- 9) A message is created in the order from lower digits to higher digits of the calculated 16-bit data (X).

Example)

When data is [02H][07H], the CRC-16 becomes 1241H.

Then the error check data becomes [41H][12H].

```

Reference: CRC-16 calculation program (C language)
***** CRC-16 calculation program *****/
#include <stdio.h>
#include <conio.h>

void main(void){
    /** Internal variable declaration ***/
    unsigned int iLoopCnt;           /* Loop counter*/
    unsigned short usData;          /* Input data*/
    unsigned short usCrcData;        /* CRC-16 data*/
    unsigned short usErrChkData;     /* Error check data*/
    int iDummy;                     /* Dummy variable*/

    /* (1) Initialization of output result of a CRC-16 data */
    usCrcData = 0xffff;

    printf("Enter the hexadecimal data (Cancel by [q].) >\n");
    while( scanf("%x", &usData) != 0){

        /* (2) (6) Taking exclusive OR of the CRC output result and the entered data */
        usCrcData = usData ^ usCrcData;

        /** CRC calculation processing ***/
        /* (5) Repetition up to 8-bit shifts */
        for(iLoopCnt = 0 ; iLoopCnt < 8 ; iLoopCnt++){
            /* (4) Checking if there is a carry. */
            if(usCrcData & 0x0001){
                /* (4) At a carry activated */
                /* (3) 1-bit shifting of the CRC output result to the right */
                usCrcData = usCrcData >> 1;

                /* (4) Taking exclusive OR with A001H */
                usCrcData = usCrcData ^ 0xa001;
            }else{
                /* (4) At a carry no activated */
                /* (3) 1-bit shifting of the CRC output result to the right */
                usCrcData = usCrcData >> 1;
            }
        } /* for */

    }; /* while */

    printf("The CRC-16 data is %xH.", usCrcData);

    /* Error check data creation*/
    usErrChkData = (usCrcData >> 8) | (usCrcData << 8);
    printf("The data for the error check is %xH.", usErrChkData);

    iDummy = getch();
}

```

2. LRC calculation method

The data from a slave address up to the end of the data are calculated by the following procedure.

- 1) A message is created in the RTU mode.
- 2) The data from the start (slave address) to the end are added. →X
- 3) The complement (Bit inversion) of X is taken. →X'
- 4) 1 is added. (X=X+1)
- 5) X' is attached at the end of the message as the LRC.
- 6) The entire data is converted into the ASCII character.

Example) When the data is [02H][07H], the LRC becomes F7H. Therefore the binary message becomes [02H][07H][F7H] and the ASCII message becomes [30H][32H][30H][37H][46H][37H].

7-3-6 Precautions at the time of data processing

- 1) As the measurement data and the decimal place are assigned to different numbers, it is necessary to use both information at replaying the data.
- 2) As each 1 data can be accessed (changed), precautions are necessary at the time of setting the associated data including Initialization process of the associated data due to change of a range number, etc.
- 3) Read and write the data in the range stipulated by the reference number. Reading and writing of reference number not stipulated may have an adverse effect on the instrument operation.
- 4) At the reading of continuous reference numbers, the data of the reference number not stipulated becomes "0".
- 5) At the writing to continuous reference numbers, if error is detected, all the settings become disabled.

7-4 Message creation

A message is consisted of 1) Slave address, 2) Function code, 3) Data part and 4) Error check code. (Refer to Para. 7-3)

The number of data that can be read once is within the following range.

Transmission mode	Number of data
RTU	120
ASCII	120

The creating method of a message is explained in the following example.

Example) Reading of the measurement data of “Channel 1” of this unit set by the “Slave address 02”.

7-4-1 RTU mode message

1) Slave address: 02 ([02H])

2) Function code: 04 ([04H])

It is the reading of the analog input data (contents of input register). When the function code is “04”, it is necessary to specify “Relative number of data 2 bytes” for reading in the data part and “Number of data 2 byte” for reading. (Refer to Para. 7-5 Refer to Para. 7-5-4 for “Function code: 04”.)

* It is necessary to confirm the number of bytes of data.

3)Data part: Starting relative number 100 ([00H][64H]), Number of data 2 ([00H][02H])

The measured data (analog input data) is stored in the reference number 30001 to 40000. (Refer to Para. 7-3-4 Table 3). By the reference table, you will understand that the integer part of CH1 is stored in “30101” and the decimal place is stored in "30102". (Refer to Para. 7-5 and refer to Para. 7-5-3 for reading of measured data.) The relative number of the starting “Reference number 30101” is $30101 - 30001 = 100$. If it is expressed in 2 bytes, it becomes “[00H][64H]”. The number of data to be read is the integer part of CH 1 and the decimal place and if it is expressed in the hexadecimal 2 bytes, it becomes “[00H][02H]”.

4)Error check: Calculation by the CRC-16 2730H ([30H][27H])

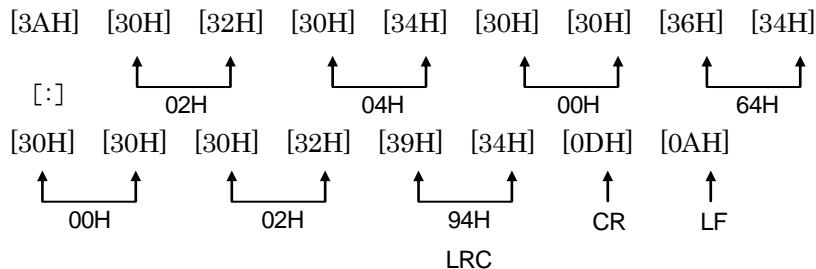

The error check in RTU mode is performed by the CRC-16. (Refer to Para. 7-3-5) The data of basic part of the message becomes [02H][04H][00H][64H][00H][02H] as per 1) to 3), and the CRC-16 becomes 2730H. Therefore the error check data becomes [30H][27H].

5) Message: A message is created with the configuration of [02H][04H][00H][64H][00H][02H][30H][27H].(Refer to 7-3)

7-4-2 ASCII mode message

The error check LRC is calculated from basic part of the message. The LRC becomes 94H. (Refer to 7-3-5). Each data of the basic part is converted into the ASCII code. In addition, the LRC is converted into ASCII code and is attached to the basic part. The start character of the message ":" , and "CR" and "LF" are added to the end.

(Example) In case of 02H, 04H, 00H, 64H, 00H, 02H, 30H and 27H

7-5 Function Code

The response for each function is given below. (Refer to <Table 2 Function code table> in Para. 7-3-2 and Refer to 7-6 for responses for abnormality).

7-5-1 Reading of digital setting values (Reading of coil status)

Function code : 01 [01H]

“Digital (ON/OFF) setting values with the continuous numbers” are read for the number of data specified from the start number specified. The ON/OFF data is arranged per 8 by 8 in numerical order in 1 data (1 byte) and configures a data of the response message. The LSB (D0 side) of each data is the digital data of the youngest number. When the number of read data pieces is not in multiples of 8, the unnecessary bits become 0.

Example) Reading of 10 digital setting value reference numbers from 8 to 17 of the slave 2

Reference number	8	9	10	11	12	13	14	15	16	17
Data	-	-	-	-	-	-	-	-	-	ON

“0” is responded as no reference number exists.

Record
ON

< RTU mode >

Master → Instrument

Slave address	02H
Function code	01H
Start No. (H)	00H
End No. (L)	07H
Number of data (H)	00H
Number of data (L)	0AH
CRC (L)	0DH
CRC (H)	FFH

Master → Instrument

Slave address	02H

15	-----	8						

Next 8 data

0	0	0	0	0	0	0	1	0	(02H)
15	-----	8							

Reference number 17 16

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LR	EC	LR	F9H
----	----	----	-----

*The start number (Relative number) is “Reference number - 1”. (Decimal 7 (= 8 - 1) → Hexadecimal 07H)

*The data pieces are the number of bytes of data.

(It differs from the number of data requested. In the example, the requested number of data is 10 and the data pieces are 2.)

7-5-2 Reading of digital input data (Reading of input relay status)

Function code : 02 [02H]

“Digital (ON/OFF) input data with the continuous numbers” are read for the number of data specified from the start number specified. The ON/OFF data is arranged per 8 by 8 in numerical order in 1 data (1 byte) and configures a data of the response message. The LSB (D0 side) of each data is the digital data of the youngest number. When the number of read data pieces is not in multiples of 8, the unnecessary bits become 0.

The start number (Relative number) is “Reference number - 10001”.

Example) Reading of 4 digital input setting value reference numbers from 10109 to 10112 of the slave 2

Reference number	10109	10110	10111	10112	10113	10114	10115	10116
Data	ON	OFF	ON	OFF	-	-	-	-
Level 1	Level 2	Level 3	Level 4	“0” is responded as no reference number exists.				
CH1 Event activation status

CRC (L)	81H
CRC (H)	CFH

First 8 data

0 0 0 0 0 1 0 1 (05H)

Reference number 10112 -----10109

“0” is responded as the reference numbers from 10113 to 10116 do not exist.

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	8CH	LRC	F6H
-----	-----	-----	-----

*The start number (Relative number) is “Reference number - 10001”.

(Decimal 108 (= 10109 - 10001) → Hexadecimal 6CH)

*The data pieces are the number of bytes of data.

(It differs from the number of data requested. In the example, the requested number of data is 4 and the data piece is 1.)

7-5-3 Reading of analog setting values (Reading of maintenance register contents)

Function code : 03 [03H]

“Analog setting values (2 bytes: 16 bits) with the continuous numbers” are read for the number of data specified from the start number specified. The data is arranged by splitting into higher 8 bits and lower 8 bits in numerical order and configures a data of the response message.

Example) Reading of the range high/low limits and the decimal point of Channel 1 of the slave 2
(Reading of 3 analog setting value reference numbers from 40104 to 40106 of the slave 2)

Reference number	40104	40105	40106	
Data	0 (0000H)	1000 (03E8H)	1 (0001H)	← Data example 0.0 to 100.0

<RTU mode>

Master → Instrument

Slave address	02H
Function code	03H
Start No. (H)	00H
End No. (L)	67H
Number of data (H)	00H
Number of data (L)	03H
CRC (L)	B4H
CRC (H)	27H

Master → Instrument

Slave address	02H
Function code	03H
Data pieces	06H
Low limit value data (H)	00H
Low limit value data (L)	00H
High limit value data (H)	03H
High limit value data (L)	E8H
Decimal point data (H)	00H
Decimal point data (L)	01H
CRC (L)	74H
CRC (H)	35H

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	91H
-----	-----

LRC	09H
-----	-----

*The start number (Relative number) is “Reference number - 40001”.

(Decimal 103 (= 40104 - 40001) → Hexadecimal 67H)

*The data pieces are the number of bytes of data.

(It differs from the number of data requested. In the example, the requested number of data is 3 and the data pieces are 6.)

*There is a limitation on the data pieces for the message (that this unit can transmit) that can be received at a time. (Refer to Para. 7.4)

7-5-4 Reading of analog input data (Reading of input register contents)

Function code : 04 [04H]

“Analog input data (2 bytes: 16 bits) with the continuous numbers” are read for the number of data specified from the start number specified. The data is arranged by splitting into higher 8 bits and lower 8 bits in numerical order and configures a data of the response message. The response example is same as “Function code 03”, but the start number (Relative number) is “Reference number – 30001”.

7-5-5 Writing of digital setting values (Changing of single coil status)

Function code : 05 [05H]

The digital setting value specified is put into the status (ON/OFF) specified.

Example) Execution of the marker text writing of the slave 2 (The digital setting value reference number 20 of the slave 2 is turned ON.)

<RTU mode>

Master → Instrument		Instrument → Master (Normal)	
Slave address	02H	Slave address	02H

CRC (L)	7DH	CRC (L)	7DH
CRC (H)	CCH	CRC (H)	CCH

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	E7H	LRC	E7H
-----	-----	-----	-----

*In case of a normal response, the response is same as a command message.

*The setting value number (Relative number) is “Reference number - 1”.

(Decimal 19 (= 20 - 1) → Hexadecimal 13H)

*Set “F00HH” at the execution. In the key lock and the record ON/OFF, set “0000H” to turn OFF and “FF00H” to turn ON.

*When the slave address is set to 0, all slaves perform this command, but no slave responds.

7-5-6 Writing of analog setting values (Writing of single maintenance resister)

Function code : 06 [06H]

The analog setting value specified is put into the value specified.

Example) Setting of the sensor correction value of Channel 1 of the slave 2 to 20

(Setting of the analog setting value reference number 40111 of the slave 2 to “20”.)

<RTU mode>

Master → Instrument

Slave address	02H
Function code	06H
Setting value No. (H)	00H
Setting value No. (L)	6EH
Setting data (H)	00H
Setting data (L)	14H
CRC (L)	E8H
CRC (H)	2BH

Instrument → Master (Normal)

Function code	06H
Setting value No. (H)	00H
Setting value No. (L)	6EH
Setting data (H)	00H
Setting data (L)	14H
CRC (L)	E8H
CRC (H)	2BH

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	76H
-----	-----

LRC	76H
-----	-----

*In case of a normal response, the response is same as a command message.

*The setting value number (Relative number) is “Reference number - 40001”.

(Decimal 110 (= 40111 - 40001) → Hexadecimal 6EH)

*When the slave address is set to 0, all slaves perform this command, but no slave responds.

7-5-7 Loop back test

Function code : 08 [08H]

The transmission check is performed between the master and slaves. The response is performed according to the diagnosis code specified. With this unit, "Return check by transmitting the received data as it is" is performed and the diagnosis code is fixed with "0000H".

Example) Execution of "Loop back test" in the slave 2

<RTU mode>

Master → Instrument		Instrument → Master (Normal)	
Slave address	02H	Slave address	02H
Function code	08H	Function code	08H
Diagnosis code (H)	Fixed 00H	Diagnosis code (H)	00H

CRC (H)	*	CRC (H)	*

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	*	LRC	*
-----	---	-----	---

7-5-8 Writing multiple analog setting values (Writing to multiple maintenance registers)

Function code : 16 [10H]

The specified number of the analog setting values from the start number specified is put into the values specified. The data is arranged and sent by splitting into higher 8 bits and lower 8 bits in numerical order.

Example) Setting of the range high/low limit values and the decimal point of Channel 1 of the slave 2 to 0.0 to 100.0

(Setting of 3 analog setting value reference numbers from 40104 to 40106 of the slave 2)

Reference number	40104	40105	40106
Data	0 (0000H)	1000 (03E8H)	1 (0001H)

← Data example 0.0 to 100.0

<RTU mode>

Master → Instrument

Slave address	02H
Function code	10H
Start No. (H)	00H
End No. (L)	67H
Number of data (H)	00H
Number of data (L)	03H
Data pieces	06H
First data (H)	00H
First data (L)	00H
Second data (H)	03H
Second data (L)	E8H
Third data (H)	00H
Third data (L)	01H
CRC (L)	10H
CRC (H)	97H

Instrument → Master (Normal)

Slave address	02H
Function code	10H
Start No. (H)	00H
End No. (L)	67H
Number of data (H)	00H
Number of data (L)	03H
CRC (L)	31H
CRC (H)	E4H

<ASCII mode error check>

Error check: The CRC (L) and the CRC (H) parts are as follows.

LRC	92H	LRC	84H
-----	-----	-----	-----

*The start number (Relative number) is “Reference number - 40001”.

(Decimal 103 (= 40104 - 40001) → Hexadecimal 67H)

*When the slave address is set to 0, all slaves perform this command, but no slave responds.

*There is a limitation on the data pieces for the message (that this unit can receive) that can be sent at a time. (Refer to Para. 7-4)

7-6 Process during abnormality

The followings are responses when there is an error in the message content from the master.

7-6-1 No response

In the following cases, the message is ignored and no response is performed.

- 1) When a transmission error (overrun, framing, parity, CRC, or LRC) is detected in the message
- 2) When the slave address in the message is not ones own address
- 3) When the data interval of the message is long
 - RTU mode... 28 bits hour or more
 - ASCII mode ... 1 second or more
- 4) When the transmission parameter does not match
- 5) When the received message exceeds 512 bytes

*When the slave address is “0” in the writing function, if there is no error in the message, the message is performed but no response is performed.

7-6-2 Error message response

When the following error is detected in the message content not having any error shown in Para. 7-6-1 from the master, the code showing its error content is responded as the “Error message”.

The format of the error message is as follows.

Slave address
Function code + 80H
Error code
CRC (L)
CRC (H)

Function code	Function code + 80H
02	82H
03	83H
04	84H
06	86H
08	88H
16	90H

The error codes are as follows.

Error code	Content
01H	Defect of a function code When the function code not defined is received
02H	Defect of a Relative number (Reference number) When the received starting number or the received setting value number are other than defined
03H	Defect of the number of data In case of any of the followings 1) When the received function code and the number of data do not match <ul style="list-style-type: none">• When “data pieces” is not twice the “number of data” in case of the function code “16”• When “Data count” disagrees with “Received data count” when the function code is “16” 2) When the number of data to be sent in response to the received message exceeds the number of data defined <ul style="list-style-type: none">• Maximum 120 data (RTU)• Maximum 120 data (ASCII)
11H	Out of setting value range (Set error) In case of any of the followings 1) For the range No., etc. not defined 2) When the setting value (binary) exceeds the range of “-30000 to 30000” 3) When the decimal point data exceeds the range of “0 to 3” 4) When the RJ is set to “internal” for other than thermocouple input ranges 5) When the burnout is set to “enable” for other than thermocouple input ranges, etc.
12H	Setting impossible When a setting message is received in any of the following cases 1) When the parameter setting message for multiple channels at the parameter setting for each channel 2) When the parameter setting message for an optional function not built-in (“0” is responded to a message for reading.) 3) When the setting is being performed through the instrument and the Web screen 4) When the setting content is being registered (The registration starts 3 seconds after the last setting frame is received. The registration takes about 1 second.)

*About the exponent part form data format.

MSB(15)	(14)	(5)	(4)	(3)	LSB(0)
Integer part sign	Integer part(10 bit)	Exponent part sign	Exponent part(4 bit)		

Integer part sign :sign 0(+)/1(-)

Exponent part sign :sign 0(+)/1(-)

*About the error

1023	:Over	High limit over flow
1022	:Under	Low limit over flow
1021	:RJ	RJ error
1020	:BURN	Burnout
1019	:Cal	Calculation error
1018	:Other error	
1017	:Invalid data	

* About the decimal point/status information

MSB(15)	(11)	(7)	(4)	(3)	LSB(0)
0	0	EV4	EV3	EV2	EV1
EV1 to 4 : Each alarm status	0 (Not activated)/1 (activated)				
ERR : Input part status	0 (normal)/1 (abnormal)				
BURN : Sensor disconnection	0 (Not activated)/1 (activated)				
OF : Overflow error	0 (Not activated)/1 (activated)				
UF : Underflow error	0 (Not activated)/1 (activated)				
DP : Data decimal place	0 0 0 0 : 0, 0 0 0 1 : 1, 0 0 1 0 : 2, 0 0 1 1 : 3

9 Setting/displaying on Web screen (Option)

9-1 Display and settings using the Web screen

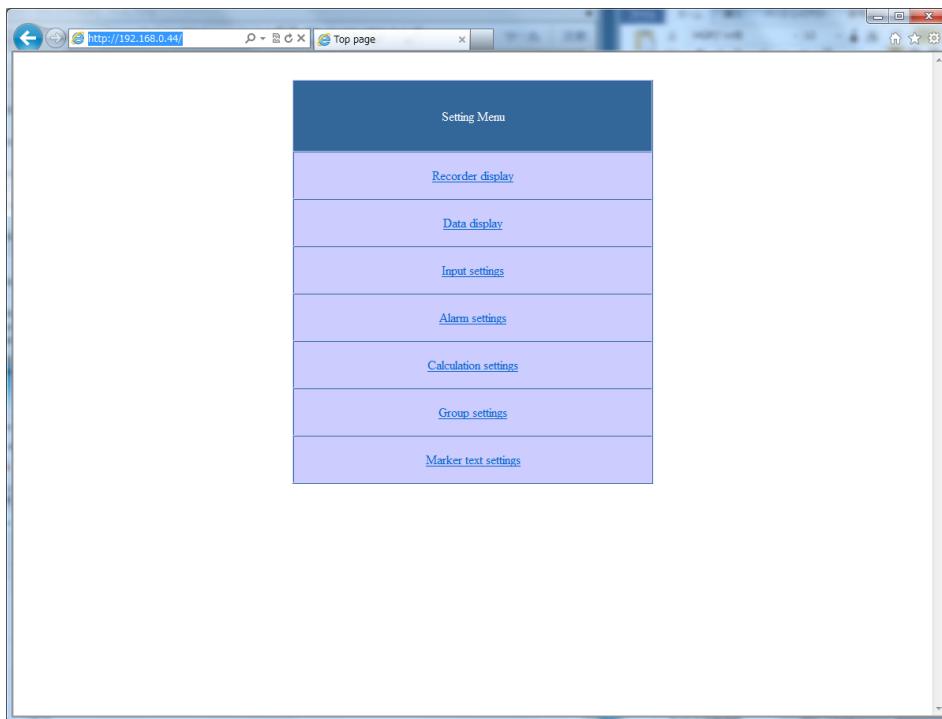

By using the web browser, the settings relating to inputs and records of this recorder can be configured and the data can be displayed.

9-1-1 Top page

By accessing to the IP address of this recorder via the web browser (The figure shows Internet Explorer), the following screen is displayed after the password authentication.

The user name used for the password authentication is fixed as the “user” and cannot be changed.

However, the password can be changed to arbitrary characters at this recorder side. When the Link button is clicked, the screen moves to the “Recorder display” for displaying the same screen, on which the same operation can be executed, as this recorder on the browser, the “Data display” for displaying the data of each recording channel, the “Input settings” for setting input parameters of every channel, the “Alarm settings” for setting alarm parameters, the “Calculation settings” for setting formulas of every channel, the “Group settings” for setting record-related-items and the “Marker text setting” for setting marker texts.

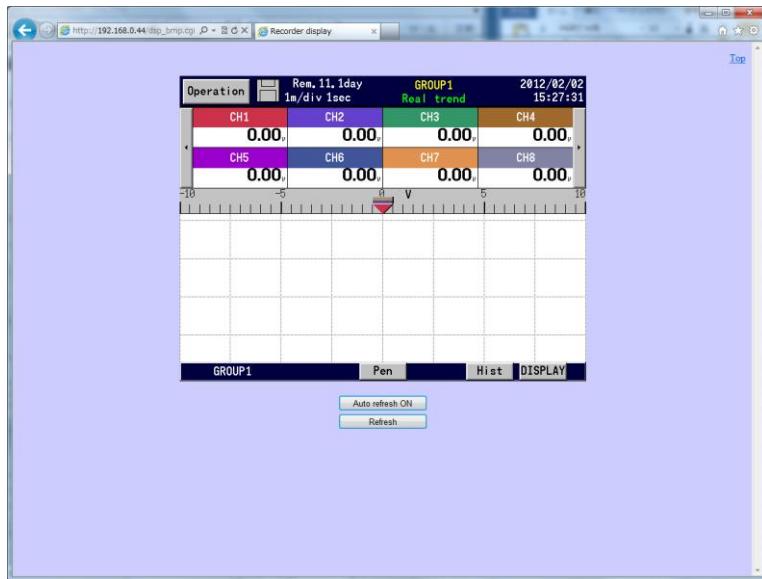

9-1-2 Recorder display

The same contents as this recorder are displayed. The keys arranged at the lower part of the screen can be operated like the keys of this recorder. If click the screen by mouse, it is possible to operate as same as touch panel operation like the main instrument. Because of the image file used, it takes more time for loading than other screens. For preventing operational error, do not operate this recorder and this screen together at the same time.

Do not use the “Refresh”, “Back”, “Forward”, etc. on the browser and use the keys at the lower part screen.

When the ‘Refresh’ key at the lower right of the screen is clicked, the current display is reloaded. By clicking the “Auto refresh ON”, the screen is updated at about 1 minute interval. For stopping the auto refresh, click the “Auto refresh OFF”.

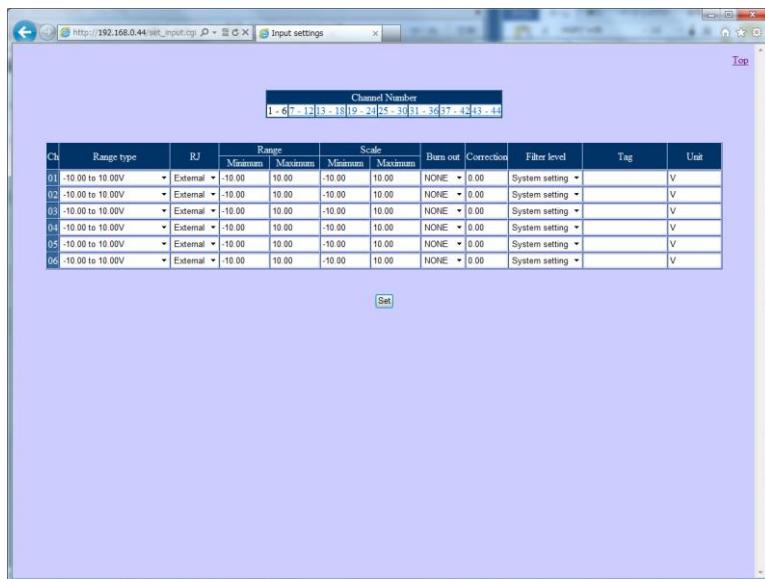

9-1-3 Data display

The data of 44 channels of this recorder are displayed with tag names and engineering units. Two kinds of screens are selectable, the screen fixedly displaying data obtained at the time of displaying it and the screen displaying data automatically updated every 10 seconds. When the link is clicked on the top page, the screen moves to the screen fixedly displaying data obtained at the time of displaying it. For moving to the automatic updating screen, click the “Start auto refresh” link at the lower part of the screen. Also, for moving to the fixed display during the automatic updating display, click the “Stop auto refresh” link at the lower part of the screen.

Channel number	Tag	Data	Unit	Channel number	Tag	Data	Unit
01		0.00	V	23		0.00	V
02		0.00	V	24		0.00	V
03		0.00	V	25		0.00	V
04		0.00	V	26		0.00	V
05		0.00	V	27		0.00	V
06		0.00	V	28		0.00	V
07		0.00	V	29		0.00	V
08		0.00	V	30		0.00	V
09		0.00	V	31		0.00	V
10		0.00	V	32		0.00	V
11		0.00	V	33		0.00	V
12		0.00	V	34		0.00	V
13		0.00	V	35		0.00	V
14		0.00	V	36		0.00	V
15		0.00	V	37		0.00	V
16		0.00	V	38		0.00	V
17		0.00	V	39		0.00	V
18		0.00	V	40		0.00	V
19		0.00	V	41		0	
20		0.00	V	42		1	
21		0.00	V	43		1	
22		0.00	V	44		1	

9-1-4 Input settings

This is for changing the settings of the input parameters of this recorder. By clicking the "Set" button after entering each item, the setting contents are written in this recorder. The settings of 6 channels are displayed on 1 screen and the displaying channel block can be switched by selecting the link from the "Channel number" table at the upper part of the screen. The settings cannot be changed during recording.

Setting items	Contents
Range type	Select the input range.
RJ	Select the reference junction compensation from internal or external.
Range Minimum	Set the minimum value of the range.
Range Maximum	Set the maximum value of the range.
Scale Minimum	Set the minimum value of the scale.
Scale Maximum	Set the maximum value of the scale.
Burn out	Select the burn out from up, down or none.
Correction	Set the value (shift value) added to the input value.
Filter level	The input filter level can be set from 0 to 3. 0 means no-filter and 3 means the strongest filter. When [system settings] is selected, settings are following [system settings] – [other settings].
Tag	Set the tag name for the data with maximum 15 characters.
Unit	Set the engineering unit for the data with maximum 7 characters.

9-1-5 Alarm settings

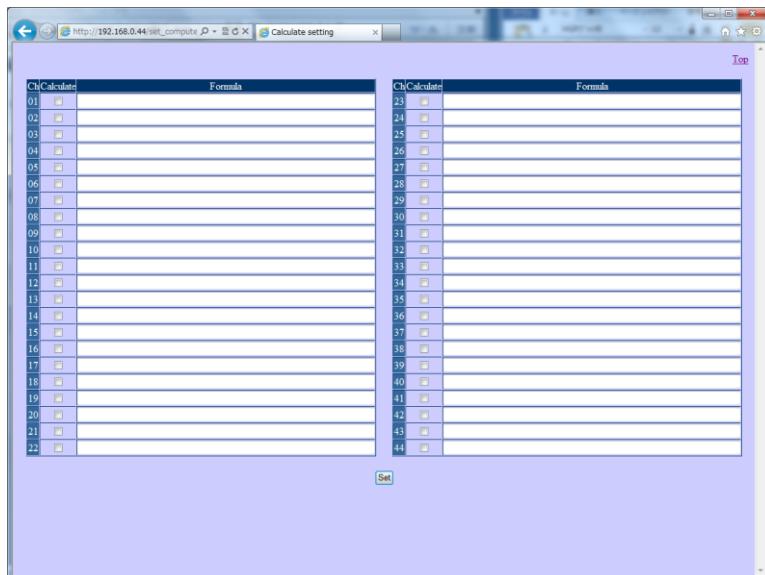

This is for changing the settings of the alarm parameters of this recorder. By clicking the "Set" button after entering each item, the setting contents are written in this recorder. The settings of 6 channels are displayed on 1 screen and the displaying channel block can be switched by selecting the link from the "Channel number" table at the upper part of the screen.

Setting items	Contents
Alarm 1 to 4 Type	Select the alarm type.
Alarm 1 to 4 Alarm value	Set the alarm value of each alarm.
Alarm 1 to 4 Reference CH	When the differential alarm is set in the alarm type of each alarm, select the reference channel.
Alarm 1 to 4 Dead band	Set the dead band of each alarm.
Alarm 1 to 4 Delay	Set the delay of each alarm from 0 to 3600 seconds.
Alarm 1 to 4 Relay	Select the output destination relay number at the activation of each alarm.
Alarm 1 to 4 AND/OR	Set the alarm output mode.

9-1-6 Calculation settings

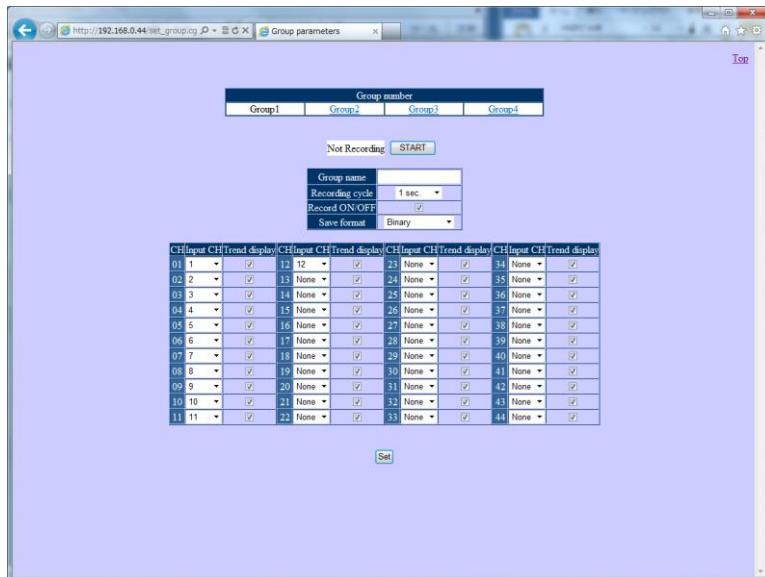

This is for selecting whether the calculation for each channel of this recorder is used or not, and for setting the formula. When the “Set” button is clicked after entering each item, the setting contents are written in this recorder. The settings cannot be changed during recording.

Setting items	Contents
Calculate	Select whether the calculation is used or not.
Formula	Set the formula with maximum 48 characters.

9-1-7 Group settings

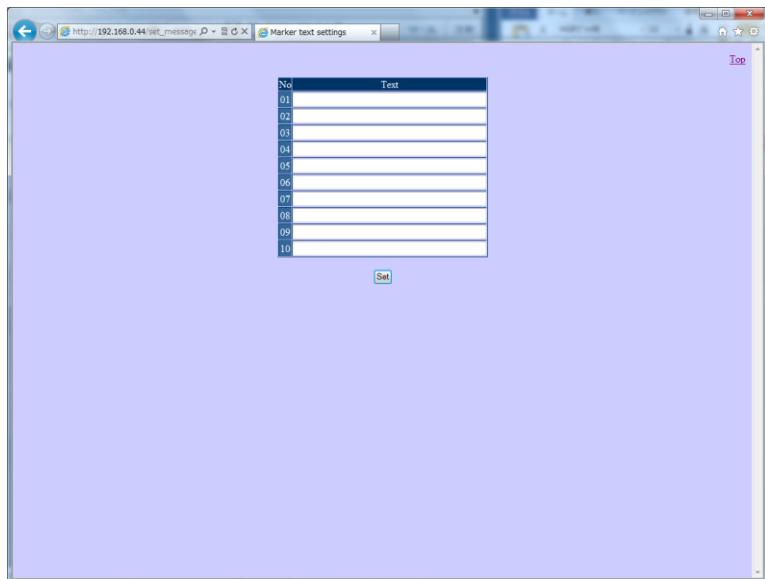

This is for changing the settings of the record-related-parameters of this recorder. When the "Set" button is clicked after entering each item, the setting contents are written in this recorder. The settings of one group are displayed on one screen. The group to be displayed can be switched by selecting from the "Group number" table on the upper part of the screen. The group that can be selected here is the groups from the Group 1 to the usage group count set in "System settings" → "Other settings" of this recorder. The settings of the group with the Record ON/OFF checked cannot be changed during recording.

Setting items	Contents
Group name	Set the group name with maximum 16 characters.
Recording period	Select the time interval for displaying and recording the data.
Record ON/OFF	Select whether its group is recorded or not.
Save format	Select the file format for recording the data into a CF card.
Input CH	Select the input channel number to be recorded in each recording channel.
Trend display	Select whether the trends of each channel are displayed or not on the screen.

9-1-8 Marker text settings

This is for changing the settings of the marker text parameters of this recorder. When the “Set” button is clicked after entering each item, the setting contents are written in this recorder. By setting the text at the last column (No. 10 in the figure), 10 more columns are displayed. Up to 50 texts can be registered.

Setting items	Contents
Text (No. 01 to 50)	Set the marker text with maximum 30 characters.
